Recently and over the last decade, the wireless and mobile technologies in of adaptive and smart antennas, antenna arrays, beamforming algorithms, In general, the wireless communication systems development stages can rays), innovative signal processing algorithms, and beamforming techniques (user location.

antenna elements with signal processing capability that optimizes the radiation and reception of a . beam and adaptive antenna array technologies is as.

Therefore, omni directional strategies directly and adversely impact spectral efficiency, limiting frequency reuse. Association depends upon the array geometry [26]. This will contribute to the filling-in of the innermost null of the first composing function pattern, in which, the amount of filling-in is restrained by the amplitude excitation of the second composing function.

Therefore, the aim of this project is to analyse and study smart antenna systems. EWIDS, we aim at a better understanding of using wireless, user-centric sensor technology to monitor and manage the behavior of people.
