The posterior nasal cavity and septum are innervated primarily by the lateral posterior superior, lateral inferior posterior, and nasopalatine nerves of V2. Therefore, the most effective heliox systems are closed systems.

The larynx may be reached with local anesthetic using the same methods as for Anatomical Models. Patients undergoing awake fiber-optic intubation are routinely anesthetized topically and are without reaction upon tracheal contact. The adverse effects of PEEP on the cardiovascular systems cannot be overlooked. Other blocks may be performed, such as maxillary and mandibular nerve blocks. Sedation should not be to the point of airway obstruction or disinhibition of the patient.
